RAR RAR Wheelchairs are vehicles used for the transport of users who may have some degree of weakness or immobility to transport them from one location to another. A conventional wheelchair is composed of a frame assembly, a seat supported by the frame assembly, and wheels disposed upon the frame assembly. A conventional wheelchair may include a pair of rear wheels, and one or more pairs of front wheels wherein the number of wheels depends upon the application. When a user utilizes a wheelchair, the user sits in the seat, which is supported by the frame assembly. A transfer assembly may be used to assist the user in entering and exiting the wheelchair, particularly when the user is entering or leaving the wheelchair for the first or last time. The transfer assembly may be formed as part of the wheelchair or may be an independent apparatus that is connected to the wheelchair. The transfer assembly may function as a support to allow the user to enter and exit the wheelchair in an easy and safe manner and is commonly referred to as a transfer vehicle or transfer station. Some transfer assemblies comprise a pair of tracks that are disposed at a distance from the wheel base of the wheelchair. The wheelchair is moved between the tracks. The wheelchair is supported in the tracks by a pair of parallel rollers, which allow the wheelchair to roll. Some of the rollers may be driven by motors that may be controlled by remote controls. Some of the rollers may be freely rotatable. The tracks can be disposed parallel to the wheel base of the wheelchair. Typically, the tracks have a rigid structure formed from an elongated member, such as a pipe or tube, and the tracks can have a U-shaped or V-shaped structure. Some transfer assemblies may include means for adapting the wheelchair for use with a wide variety of standard wheelchairs. Some of the means for adapting comprise a wheel cradle that can be attached or coupled to the standard wheelchair to make the transfer assembly an integral part of the wheelchair. Some of the means for adapting a standard wheelchair comprise a first wheel cradle that receives the standard wheelchair and can be coupled to the standard wheelchair, and a second wheel cradle that receives f678ea9f9e
